                                                                                                                                                                                                                                                                                                                              The present sequence is the protein sequence of Streptococcus sobrinus glucosyltransferase-I (GTF-I). Peptide fragments of GTF-I, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class II protein-binding peptide from S. mutants glucan binding protein-B (GbpB) covalently linked with a peptide fragment of a streptococcal collections. The compositions are used in a claimed method of glucosyltransferase. The compositions are used in a claimed method of glucosyltransferase. The compositions are used in a claimed method of

                                                                                                                                                                                                                                                                             eliciting production of an antibody in a mammal Diepitopic or multiepitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 16; Page 14; 49pp; English.

The DNA was obtd. by treating S. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with Sau3AI and fractionating on agarose gel. The 3-5 kbp fragment was ligated into pUC18 and E. coli JMN19 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for dental caries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Streptococcus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by Streptococcus mutans, particularly mouse-hybridoma MHP126 (FERM P-17567), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl transferase-B and is used in the immunotherapy of dental caries. This transferase-B and is used in the immunotherapy of dental caries. This

chlorophyll AB binding protein to produce a transgenic plant, and glucan is produced in the amyloplast of potato or the vacuole of sugar beet. Glucans are useful as substitutes for and additions to modified starch and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produce chemical effluents, paper manufacture utilising the glucan produced by GTF, which utilises biologically produced input materials, is more cost-effective and environmentally friendly. Moreover, glucans also exhibit thermoplastic properties and impart gloss to the paper during coating step. The present sequence represents GTFC

conditions to produce a regenerated plant and inducing expression of the polymucleotide for a time sufficient to produce the glucan in the regenerated plant, where the vector contains a transit sequence from ribulose biphosphate carboxylase small subunit, waxy, brittle-1 and

The invention relates to a monoclonal antibody against dental caries and an anti-caries agent composed of a monoclonal antibody produced by streptococcus mutans, particularly mouse-hybridoma MHP126 (FERM P-17567), against an enzyme having inhibitive activity against water insoluble glucan synthetase of glucosyl transferase-B. The monoclonal antibody specifically inhibits water insoluble glucan synthetase of Streptococcus mutans produced glucosyl transferase-B and is used in the immunotherapy of dental caries. This transferase-B and is used in the immunotherapy of dental caries. This

                                                                                                                                    The present sequence is the protein sequence of Streptococcus mutans glucosyltransferase-C (GTF-C). Peptide fragments of GTF-C, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MMC) class II proteinbinding peptide from S. mutants glucan binding protein-B (GDpB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Diepitopic or multiepitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glucosyltransferase; enzyme; vaccine; anticaries; epitope; immunogen
                                                                                                                                                                                                                                                                                                                                                         Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptococcus mutans.

CC complementary polynucleotide, a ribonucleic acid sequence encoding the CC gfF mutant, an axpression cassette comprising the polynucleotide operably CI linked to a promoter, a vector comprising the polynucleotide operably CC linked to a promoter, a vector comprising the polynucleotide operably CC cell introduced with the vector, a transgenic plant, a paper sizing and/or coaring composition comprising a glucan produced in a plant transformed CC with a gene encoding the mutant GFF, wild type or starch, a latex, CC thermoplastic molecule or their combinations or glucan and starch where CC deficient in starch biosynthesis, transformed with a gene encoding a glucan transformed with a gene encoding a glucan transformed with a gene encoding a CC glucosyltransferase B or D enzyme, wild-type or mutant and a paper CC comprising the glucan (paper sizing/coating agent). The vector is useful comprising the glucan in a plant. The method comprises transforming a CC plant cell with the vector, growing the plant cell under plant growing CC conditions to produce a regenerated plant and inducing expression of the CC conditions to produce a regenerated plant and inducing expression of the CC comprision of the vector contains a transit sequence from CC comprision of the vector contains a transit sequence from CC comprision of the vector contains a transit sequence from CC comprision of the vector contains a transit sequence from CC contains are useful as substitutes for and additions to modified starch conditions to modified star
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    16-JAN-1998;

linked to a promoter, a vector comprising the polynucleotide operably cell introduced with the vector, a transgenic plant comprising the vector, as a seed or tuber from the transgenic plant comprising the coating composition comprising a glucan produced in a plant transformed with a gene encoding the mutant GTF, wild type or, starch, a latex, child the plant transformed with a gene encoding a glucan is produced in the amyloplast and/or vacuole or a maize line child the plant and spaper comprising the glucan in a plant. The method comprises transforming a glucan in a plant transformed a paper gollutions to produce a regenerated plant and inducing expression of the plant cell under plant growing conditions to produce a transforming a transforming a conditions to produce a transforming a chlorophyll AB binding protein to produce the glucan in the conditions to suspen seet. Cc glucans are useful as substitutes for and additions to modified starch cc amountacture utilising the glucan produced by GTP, which utilises biologically produced input materials, is more cost-effective and cc environmentally friendly. Moreover, glucans also exhibit thermoplastic cromoperties and impart gloss to the paper during coating step. The present sequence represents a GTPB mutant of the invention. Note: The present consing the GTPS sequence appearing as AAU98027 and the information in cc claims the function in call the filter the produced by the indexer using the GTPS sequence appearing as AAU98027 and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     using
claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              properties and impart gloss to the paper during coating step. The sequence represents a GTFB mutant of the invention. Note: The presequence is not shown in the specification but was created by the using the GTFB sequence appearing as AAU98027 and the information
The invention an isolated protein comprising a glucosyltransferase (GTF) B polypeptide having changes at position from I448V, D457N, D567T, K1014T, D457N/D567T, D457N/D571K, D567T/D571K, D567T/D571K/K1014T, I1648V/D457N/D57TK/T90Q/K1014T, Y169A/Y170A/Y171A, and K779Q or a GTF D polypeptide having changes at positions from T589D, T589E, N471D, M471D/T589D, and N471D/T589E. Also included are a glucan produced by the GTF mutant, an isolated polynucleotide which encodes P1 or P2, or its complementary polynucleotide, a ribonucleic acid sequence encoding the GTF mutant, an expression cassette comprising the polynucleotide operably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Glucosyltransferase; coating composition; amyloplast; vacuole;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1475
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Streptococcus

Glucosyltransferase B or D protein useful for producing a glucan useful as substitutes for and additions to modified starch and latexes in paper manufacture, comprises mutations in specific positions.

```
Congrished in starch biosynthesis, transformed with a gene encoding a glucosyltransferase B or D enzyme, wild-type or mutant and a paper CC glucosyltransferase B or D enzyme, wild-type or mutant and a paper CC comprising the glucan in a plant. The method comprises transforming a CC plant cell with the vector, growing the plant cell under plant growing CC conditions to produce a regenerated plant and inducing expression of the polynucleotide for a time sufficient to produce the glucan in the CC polynucleotide for a time sufficient to produce the glucan in the CC risulose biphosphate carboxylase small subunit, waxy, brittle-1 and CC chlorophyll AB binding protein to porduce a transgenic plant, and glucan is produced in the amyloplast of potato or the vacuole of sugar beet. CC glucans are useful as substitutes for and additions to modified starch cC and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produce chemical effluents, paper CC manufacture utilising the glucan produced by GTF, which utilises biologically produced input materials, is more cost-effective and cc environmentally friendly. Moreover, glucans also exhibit thermoplastic properties and impart gloss to the paper during coating step. The present sequence is not shown in the specification but was created by the indexer using the GTFB sequence appearing as AAU98027 and the information in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            뭉

Peptide fragments of GTF-B, especially from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class II protein-binding peptide from S. mutants glucan binding protein-B (GbpB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Dispitopic or multiepitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition useful as vaccines for dental caries comprises a fragment of a glucan binding protein-B binding to a major histocompatibility complex class II protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-MAR-2002; 2002US-0363209P.

CC The invention an isolated protein comprising a glucosyltransferase (GTF) CC B polypeptide having changes at position from I448V, D457N, D567T, CC I448V,D457N,D567T,D571K/K1014T, CC I448V/D457N/D567T,D571K/K792/K104T, D567T/D571K/K7104T, CC GTF D polypeptide having changes at positions from T589D, T589E, N471D, CC GTF D polypeptide having changes at positions from T589D, T589E, N471D, CC GTF mutant, an isolated polymucleotide which encodes P1 or P2, or its complementary polymucleotide, a ribonucleic acid sequence encoding the CC GTF mutant, an expression cassette comprising the polymucleotide operably comprising the produced by the cell introduced with the vector comprising the expression cassette, host cell introduced in the vector, a transgenic plant, a paper sizing and/or vector, a seed or tuber from the transgenic plant, a paper sizing and/or coating composition comprising a glucan produced in a plant transformed with a gene encoding the mutant GTF, wild type or, starch, a latex, with a gene encoding the mutant GTF, wild type or, starch, a latex, cc the glucan is produced in the anyloplast and/or vacuole or a maize line deficient in starch biosynthesis, transformed with a gene encoding a glucan (paper sizing/coating agent). The vector is useful for producing a glucan in a plant. The method comprising the vector is produced in the vector starch and a paper comprising the vector spanerated plant and inducing expression of the polymucleotide for a time sufficient to produce the glucan in the comprises transforming a transit sequence from the polymucleotide for a time sufficient to produce the glucan in the comprise to produce a regenerated plant, where the vector contains a transit sequence from chlorosphyll AB binding protein to produce a transgenic plant, and glucan in the produce of the plant, and glucan in the amyloplast of potato or the vacuole of sugar beet.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-JUN-1995;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produce chemical effluents, paper manufacture utilising the glucan produced by GTP, which utilises biologically produced input materials, is more cost-effective and environmentally friendly. Moreover, glucans also exhibit thermoplastic properties and impart gloss to the paper during coating step. The present sequence is not shown in the specification but was created by the indexer using the GTFB sequence appearing as AAU98027 and the information in claim 36

(GTF)

GTF D polypeptide having changes at positions from T589D, T589E, N N471D/T589D, and N471D/T589E. Also included are a glucan produced GTF mutant, an isolated polynucleotide which encodes Pl or P2, or I448V/D457N/D567T/D571K/K779Q/K1014T, Y169A/Y170A/Y171A, and K779Q or a GTF D polypeptide having changes at positions from T589D, T589B, N471D,

```
CC complementary polynucleotide, a ribonucleic acid sequence encoding the CC (STF mutant, an expression cassette comprising the polynucleotide operably CC (Inked to a promoter, a vector comprising the expression cassette, host CC cell introduced with the vector, a transgenic plant comprising the CC cell introduced with the vector, a glucan produced in a plant transformed CC with a gene encoding the mutant CTF, wild type or, starch, a latex, CC thermoplastic molecule or their combinations or glucan and starch where the glucan is produced in the amyloplast and/or vacuole or a maize line CC deficient in starch biosynthesis, transformed with a gene encoding a CC glucosyltransferase B or D enzyme, wild-type or mutant and a paper CC conditions the glucan in a plant. The method comprises transforming a CC conditions to produce a regenerated plant cell under plant growing CC conditions to produce a regenerated plant and inducing expression of the CC regenerated plant, where the vector contains a transit sequence from CC ribulose biphosphate carboxylase small subunit, waxy, brittle-1 and glucan in the method or the vacuole of midar heef carboxylase small subunit, waxy, brittle-1 and glucan in the carboxylase small subunit, waxy, brittle-1 and glucan in the method comprise contains a transit sequence from contains a transit sequence from contains a transit sequence from the produced to the contains a transit sequence from the carboxylase small subunit, waxy, brittle-1 and glucan in the carboxylase small subunit, waxy, brittle-1 and glucan in the carboxylase from the vacuole of midar heef.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś

Glucans are useful as substitutes for and additions to modified starch and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produce chemical effluents, paper manufacture utilising the glucan produced by GTF, which utilises biologically produced input materials, is more cost-effective and environmentally friendly. Moreover, glucans also exhibit thermoplastic environmentally friendly.
                                                                                                                                                                                                                                                                                                                    Glucosyltransferase; GTFB; transgenic plant; paper sizing; coating composition; glucan; starch; latex; thermoplastic molecule; amyloplast; vacuole; paper manufacture; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1475 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          properties and impart gloss to the paper during coating step. The present sequence represents a GTFB mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the GTFB sequence appearing as AAU98027 and the information in

The invention an isolated protein comprising a glucosyltransferase (GTF) CC B polypeptide having changes at position from 1448V, D457N, D567T, D457N/D571K, D567T/D571K/K1014T, CC I1448V/D457N/D567T, D457N/D571K, D567T/D571K/K1014T, CC I448V/D457N/D567T,D571K/K70J4T, X169A/X170A/X17JA, and K779Q or a CC GTF D polypeptide having changes at positions from T589D, T589E, N471D, CC GTF D polypeptide having changes at positions from T589D, T589E, N471D, CC GTF mutant, an isolated polymucleotide which encodes Pl or P2, or its complementary polymucleotide, a ribonucleic acid sequence encoding the CC GTF mutant, an expression cassette comprising the polymucleotide operably clinked to a promoter, a vector comprising the polymucleotide operably collined to a promoter, a vector operation of plant comprising the vector, a transgenic plant comprising the coating composition comprising a glucan produced in a plant transformed with a gene encoding the mutant GTF, wild type or, starch, a latex, the glucan is produced in the amyloplast and/or vacuole or a maize line comprising the glucan in sproduced in the amyloplast and/or vacuole or a maize line comprising the glucan in a plant. The method comprises transforming a glucosyltransferase B or D enzyme, wild-type or mutant and a paper comprising the glucan in a plant. The method comprises transforming a plant cell with the vector, growing the plant cell under plant growing conditions to produce a time sufficient to produce the glucan in the conditions biphosphate carboxylase small subunit, waxy, brittle-1 and cclothologyllase biphosphate carboxylase small subunit, waxy, brittle-1 and glucan conditions composition of the polymologyllase mail subunit, waxy, brittle-1 and glucan conditions of the polymologyllase small subunit, waxy, brittle-1 and glucan conditions of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-JUN-1995;

                                                chlorophyll AB binding protein to produce a transgenic plant, and glucan is produced in the amyloplast of potato or the vacuole of sugar beet. Glucans are useful as substitutes for and additions to modified starch and latexes in paper manufacture. Unlike prior art techniques, which require input materials that produce chemical effluents, paper manufacture utilising the glucan produced by GTF, which utilises biologically produced input materials, is more cost-effective and biologically produced input materials, is more cost-effective and environmentally friendly. Moreover, glucans also exhibit thermoplastic properties and impart gloss to the paper during coating step. The present sequence represents a GTFB mutant of the invention. Note: The present sequence is not shown in the specification but was created by the indexer using the GTFB sequence appearing as AAU98027 and the information in claim 36
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Glucosyltransferase B or D protein useful for producing a glucan useful as substitutes for and additions to modified starch and latexes in papemanufacture, comprises mutations in specific positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             19-DEC-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 36; Page; 44pp; English.

The invention an isolated protein comprising a glucosyltransferase (GTF) CC B polypeptide having changes at position from I448V, D457N, D567T, D457N/D57TK, D567T, D57TK/K1014T, CC I448V/D457N/D567T, D457N/D57TK, D567T/D57TK/K1014T, CC I448V/D457N/D567T/D57TK/K79Q/K1014T, Y169A/Y170A/Y171A, and K779Q or a CC GTF D polypeptide having changes at positions from T589D, T589E, N471D, CC GTF mutant, an isolated polymucleotide which encodes P1 or P2, or its complementary polymucleotide, a ribonucleic acid sequence encoding the CC GTF mutant, an expression cassette comprising the polymucleotide operably clinked to a promoter, a vector comprising the expression cassette, host cell introduced with the vector, a transgenic plant comprising the coating composition comprising a glucan produced in a plant transformed coating composition comprising a glucan produced in a plant transformed coating gene encoding the mutant GTF, wild type or, starch, a latex, the glucan is produced in the amyloplast and/or vacuole or a maize line comprising the glucan is produced in the amyloplast and/or vacuole or a maize line comprising the glucan in a plant. The method comprises transforming a plant cell with the vector, growing the plant cell under plant growing conditions to produce a regenerated plant and inducing expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16-JAN-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC polynucleotide for a time sufficient to produce the glucan in the CC regenerated plant, where the vector contains a transit sequence from CC ribulose biphosphate carboxylase small subunit, waxy, brittle-1 and CC chlorophyll AB binding protein to produce a transgenic plant, and glucan CC is produced in the amyloplast of potato or the vacuole of sugar beet. CC Glucans are useful as substitutes for and additions to modified starch CC and latexes in paper manufacture. Unlike prior aft techniques, which CC require input materials that produce chemical effluente, paper CC manufacture utilising the glucan produced by GTF, which utilises CC biologically produced input materials, is more cost-effective and CC environmentally friendly. Moreover, glucans also exhibit thermoplastic CC environmentally friendly to the paper during coating step. The present CC sequence represents a GTFB mutant of the invention. Note: The present CC using the GTFB sequence appearing as AAU98027 and the information in

                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC complementary polynucleotide, a ribonucleic acid sequence encoding the CC innked to a promoter, a vector comprising the polynucleotide operably CC linked to a promoter, a vector comprising the polynucleotide operably CC call introduced with the vector, a transgenic plant comprising the CC vector, a seed or tuber from the transgenic plant, a paper sizing and/or CC coating composition comprising a glucan produced in a plant transformed CC with a gene encoding the mutant GTF, wild type or, starch, a latex, CC the glucan is produced in the amyloplast and/or vacuole or a maize line CC deficient in starch biosynthesis, transformed with a gene encoding a CC comprising the glucan in a plant. The wector vacuole or a maize line CC deficient in starch biosynthesis, transformed with a gene encoding a glucan in a plant. The method comprises transforming a plant growing the plant cell under plant growing CC comprising a glucan in a plant. The method comprises transforming a plant cell with the vector, growing the plant cell under plant growing CC riburles to produce a regenerated plant and inducing expression of the CC regenerated plant, where the vector contains a transit sequence from CC riburles binhosphate carboxylase small subunit, waxy, brittle-1 and CC riburles are useful as substitutes for and additions to modified starch CC and latexes in paper manufacture. Unlike prior art techniques, which cc require input materials that produce chemical effluents, paper CC manufacture utilising the glucan produced by GTF, which utilises CC plant growing the glucan in the specification but was created by the indexer custing step. The present CC using the GTFB sequence appearing as AAU98027 and the information in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to glucan capable of being produced by glucosyltransferase activity of a lactic acid bacterium on a sucrose substrate. The method is useful as a thickener, as a bioactive agent and as an anti-corrosion agent. The glucan can be incorporated in foodstuffs such as beverages, sauces, dressings, dairy products. The glucan is useful as anticorrosion agent, e.g. for the protection of ship hulls. It can also be incorporated in nutritional or pharmaceutical compositions intended for improving the condition of the gastrointestinal tract. The present sequence represents a sequence of the glucansucrase gene. (Updated on 23-OCT-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   glucosyltransferase activity of a lactic acid bacterium on a sucrose substrate. The method is useful as a thickener, as a prebiotic and as a bioactive agent and as an anti-corrosion agent. The glucan can be incorporated in foodstuffs such as beverages, sauces, dressings, dairy products. The glucan is useful as anticorrosion agent, e.g. for the protection of ship hulls. It can also be incorporated in nutritional or pharmaceutical compositions intended for improving the condition of the gastrointestinal tract. The present sequence represents a sequence of the
                                                           Novel glucan produced by glucosyltransferase activity of lactic acid bacterium on sucrose substrate, and having backbone consisting of alpha (1,3) - and alpha (1,6)-linked anhydroglucose units, useful as thickener.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Van

                           (for example dextran) which uses D-glucoses, such as a starch and a cellulose, as a structural unit. The modified enzyme of the invention is useful in the manufacture of glucan. The selection of the active centre area of DS which carries out transduction, enables changes in structure and character of an enzyme-reaction product and their application to various uses. The present sequence is that of a protein which is related to the Leuconostoc mesenteroides dextran sucrase protein and which was used during the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            glucosyltransferase activity of a lactic acid bacterium on a sucrose substrate. The method is useful as a thickener, as a prebiotic and as a bioactive agent and as an anti-corrosion agent. The glucan can be incorporated in foodstuffs such as beverages, sauces, dressings, dairy products. The glucan is useful as anticorrosion agent, e.g. for the protection of ship hulls. It can also be incorporated in nutritional or pharmaceutical compositions intended for improving the condition of the
                                                                                                                                                                                                                           Example 1; SEQ ID NO 11;
                                                                                                                                                                                                                                                      Novel modified dextran sucrase which exchanges one site of active center zone of dextran sucrase for active center zone of different types of dextran sucrase, useful for manufacturing glucan.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 dextran sucrase; active centre D-glucose; starch; cellulose; enzyme-reaction product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ADC54806;

                                                                                                                                                         is used to produce yoghurt, curd, cheese or other fermented milk products, ice cream, fermented cereal products, water-based jellies, infant formulae and pet foods. Dextransucrase can also be bound to e.g. vitamins or oral vaccines for delivering these to foods, using (A) as carrier. The method produces foods with attractive and uniform texture, since dextransucrase is evenly distributed and forms a thickening agent in situ, with the amount formed being controlled by the amount of dextransucrase bound. Milk does not have to be coagulated in order to achieve a good texture, so the amount of acidic by-products formed is reduced. Dextransucrase binds to many different types of cells over wide ranges of temperature and pH and the treated bacteria can be stored in liquid or powdered form. The present sequence represents the amino acid sequence of dextransucrase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dextransucrase; yoghurt; curd; cheese; fermented milk; infant formulae; pet food; vitamin; oral vaccine; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-JUL-2002
                                                                                                                               Sequence 1527 AA;
                                                                                                                                                                                                                                                                                                                                                                          The invention relates to preparation of a fermented food product that includes treating the microorganism (A) to be used for fermentation with a dextransucrase so that this binds to the cell walls of (A). The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           02-MAY-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a modified dextran sucrase (DS) exchanging one site of the active centre zone of a dextran sucrase for the active centre zone of different types of dextran sucrase. Glucan is a polysaccharide (for example dextran) which uses D-glucoses, such as a starch and a cellulose, as a structural unit. The modified enzyme of the invention is useful in the manufacture of glucan. The selection of the active centre area of DS which carries out transduction, neables changes in structure and character of an enzyme-reaction product and their application to various uses. The present sequence is that of the Leuconostoc mesenteroides dextran sucrase protein used during the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 1527 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         from the catalytic domain of the polypeptide, can be used in immunogenic compositions and subunit vaccines for dental caries. These compositions comprise a major histocompatibility complex (MHC) class II protein-binding peptide from S. mutants glucan binding protein-B (GbpB) covalently linked with a peptide fragment of a streptococcal glucosyltransferase. The compositions are used in a claimed method of eliciting production of an antibody in a mammal. Diepitopic or multispitopic polypeptides can be prepared synthetically or by recombinant DNA technology. Antibodies raised against MHC class II binding fragments of GbpB can be used in passive immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          07-MAR-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to glucan capable of being produced by glucosyltransferase activity of a lactic acid bacterium on a sucrose substrate. The method is useful as a thickener, as a prebiotic and as a bioactive agent and as an anti-corrosion agent. The glucan can be incorporated in foodstuffs such as beverages, sauces, dressings, dairy products. The glucan is useful as anticorrosion agent, e.g. for the protection of ship hulls. It can also be incorporated in nutritional or pharmaceutical compositions intended for improving the condition of the gastrointestinal tract. The present sequence represents a sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                              DSR-E; glycosyl transferase; dextran; prebiotic; microflora regulation; intestinal transit; minera colon cancer; acne; dandruff; body odour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            bacterium on sucrose substrate, and having backbone consisting \{1,3\} - and alpha \{1,6\} -linked anhydroglucose units, useful as t
The present invention relates to a novel dextran saccharase, DSR-E (ABB99574), from Leuconostoc mesenteroides MRRL B-1299. The saccharase has glycosyl transferase activity suitable for producing dextrans having alpha(1-2) branches from sucrose, p-nitrophenyl-alpha-D-glucopyranoside, alpha-fluoroglucose, alpha-D-glucopyranoside or alpha-D-galactopyranosyl-sucrose. The dextran saccharase is useful in prebiotic, pharmaceutical or cosmetic compositions. The dextrans and related compounds having alpha(1-2) bonds, produced using DSR-E, may be

                                                                                                                                                                             The present invention relates to glucan capable of being produced by glucosyltransferase activity of a lactic acid bacterium on a sucrose substrate. The method is useful as a thickener, as a prebiotic and as a bioactive agent and as an anti-corrosion agent. The glucan can be incorporated in foodstuffs such as beverages, sauces, dressings, dairy products. The glucan is useful as anticorrosion agent, e.g. for the protection of ship hulls. It can also be incorporated in nutritional or pharmaceutical compositions intended for improving the condition of the gastrointestinal tract. The present sequence represents a sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      involved in signalling/cellular recognition processes in vivo (specifically in regulation of microflora in the intestines or on the skin); and are potentially useful for improving intestinal transit, increasing assimilation of minerals (e.g. calcium and/or magnesium), preventing cancer of the colon and combating skin problems such as acne, dandruff and body odour. The present sequence is a conserved peptide sequence from the catalytic domain of the DSR-E of the invention. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel glucan produced by glucosyltransferase activity of lactic acid bacterium on sucrose substrate, and having backbone consisting of alpha (1,3)- and alpha (1,6)-linked anhydroglucose units, useful as thickener.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Glucan; glucosyltransferase activity; thickener; prebiotic; bioactive agent; anti-corrosion agent; foodstuff; gastrointestinal tract.

 Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DB
